

# Typical features of ground magnetometer observations of FLR

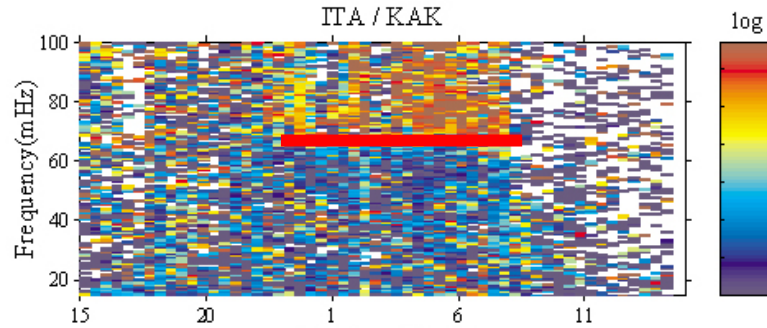

H-component-power dynamic spectra at a station named Iitate (ITA)

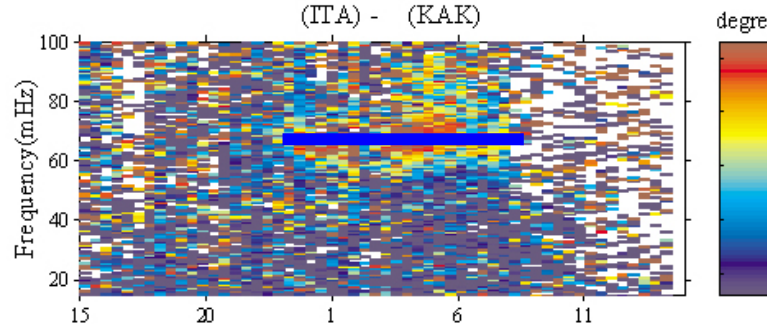

H-component-power dynamic spectra at a station named Kakioka (KAK), located ~150 km to the south of ITA

**Amplitude-ratio method** takes the amplitude ratio of the ITA and KAK data. The eigen-frequency is at the border of the red and blue colors.

**Cross-phase method** takes the phase difference of the ITA and KAK data. The eigen-frequency is at the vertical center of the red color.
